Introduction

ServiceUtils is an infrastructure project for OpenDaylight aimed at providing utilities that will assist in Operation and Maintenance of different services provided by OpenDaylight. A service is a functionality provided by the ODL controller as seen by the operator. These services can be categorized as Networking services, e.g. L2, L3/VPN, NAT etc., and Infra services, e.g. Openflow. These services are provided by different ODL projects like Netvirt, Genius and Openflowplugin and are comprised of a set of java karaf bundles and associated MD-SAL datastores.
