NeutronNorthbound: Lithium Release Notes

Major Features

Lithium release of Neutron Northbound project continues to deliver support for OpenStack base Neutron API and Neutron API extensions

Target Environment

For Execution

- OpenDaylight Lithium

For Development

- OpenDaylight Lithium

Known Issues and Limitations

- For full functionality, there is a dependency on the ODL ML2 agent passing SecurityGroup information as part of the standard port and security group APIs, rather than just on port create (as documented in bug 3304). As of this writing there is this unverified patch which has been merged to openstack Liberty head, but there is no corresponding patch to backport to Kilo.
